This is a peer-review report submitted for the paper “Continuous User Experience Monitoring of a Patient-Completed Preoperative Assessment System in the United Kingdom: Cross-sectional Study.”

Specific Comments

Minor Comments
1. The staggering of the eHealth usability scale items was a good idea. It would have been most likely unrealistic for patients to be willing to complete the scale including all of the items.
2. Besides further studying what things impacted completion times, it would also be helpful to further explore the impact of a message addressing the length of assessment completion at the start of the assessment.

Conflicts of Interest
None declared.
